Message Center Post Triage

Use this per post, to decide what each Microsoft 365 Message Center change means for your tenant. The tenant Message Center is the source of truth; public archives are copies and can differ.

1. Classify the post

Category (from the post)	What it usually needs
Action required / plan for change	Owner, deadline, test plan, user communication before the date
Retirement	Find who or what uses it, plan a replacement, set a removal date
New feature (rolling out)	Decide whether to enable, restrict by policy, or only inform users
Information only	Record, share with the relevant team, no task unless it affects you

2. Log each post

MC number	Product	Category	Affects users / admins	Deadline	Owner	Test	Done
						☐	☐
						☐	☐
						☐	☐
						☐	☐
						☐	☐
						☐	☐
						☐	☐

						☐	☐
						☐	☐

3. Decide and communicate

Question	If yes
Does the change alter sign-in, mail flow, sharing or admin rights?	Treat as high priority; involve identity or messaging owner; test in a pilot tenant or group first
Is there a date when old behaviour stops?	Create a task with that date; confirm nothing still depends on the old behaviour
Does it need an admin setting or policy change?	Document the setting, owner and change record; follow your change process
Do end users see a visible change?	Prepare a short user note; check the post for suggested wording before reusing it

4. Verify before you close a post

Check	Done
Checked in the tenant Message Center (not only in an archive)	☐
Tested in a pilot group or test tenant where the change is risky	☐
Post number, decision and owner recorded	☐
Follow-up date set if the change is not yet live for you	☐
